

Experimental content: Switch the current interface through the rocker module, there are four control interfaces. Music interface, color light interface, angle rotation interface, wind speed interface.

In the music interface, the song is switched by pressing the button.

In the color light interface, the color of the light is switched by pressing the button.

In the angle rotation interface, the rotation angle of the servo is switched by pressing the button.

In the wind speed interface, the wind speed is switched by pressing the button.

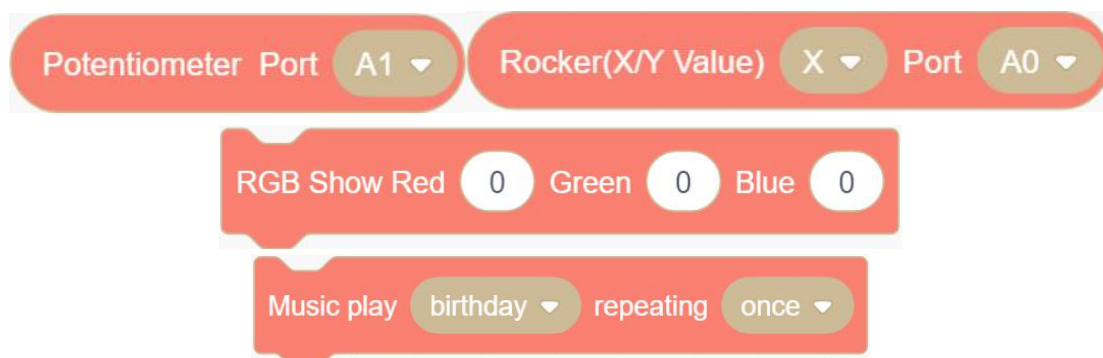

Experiment preparation: UNO board *1, Plugkit sensor expansion board *1, 4pin cable (PH2.0) * 4, USB data cable *1, RGB light module *1, Red button module *1, Rocker module *1, Motor drive module *1, Motor fan *1, 9G metal digital servo *1, 0.91 inch OLED *1

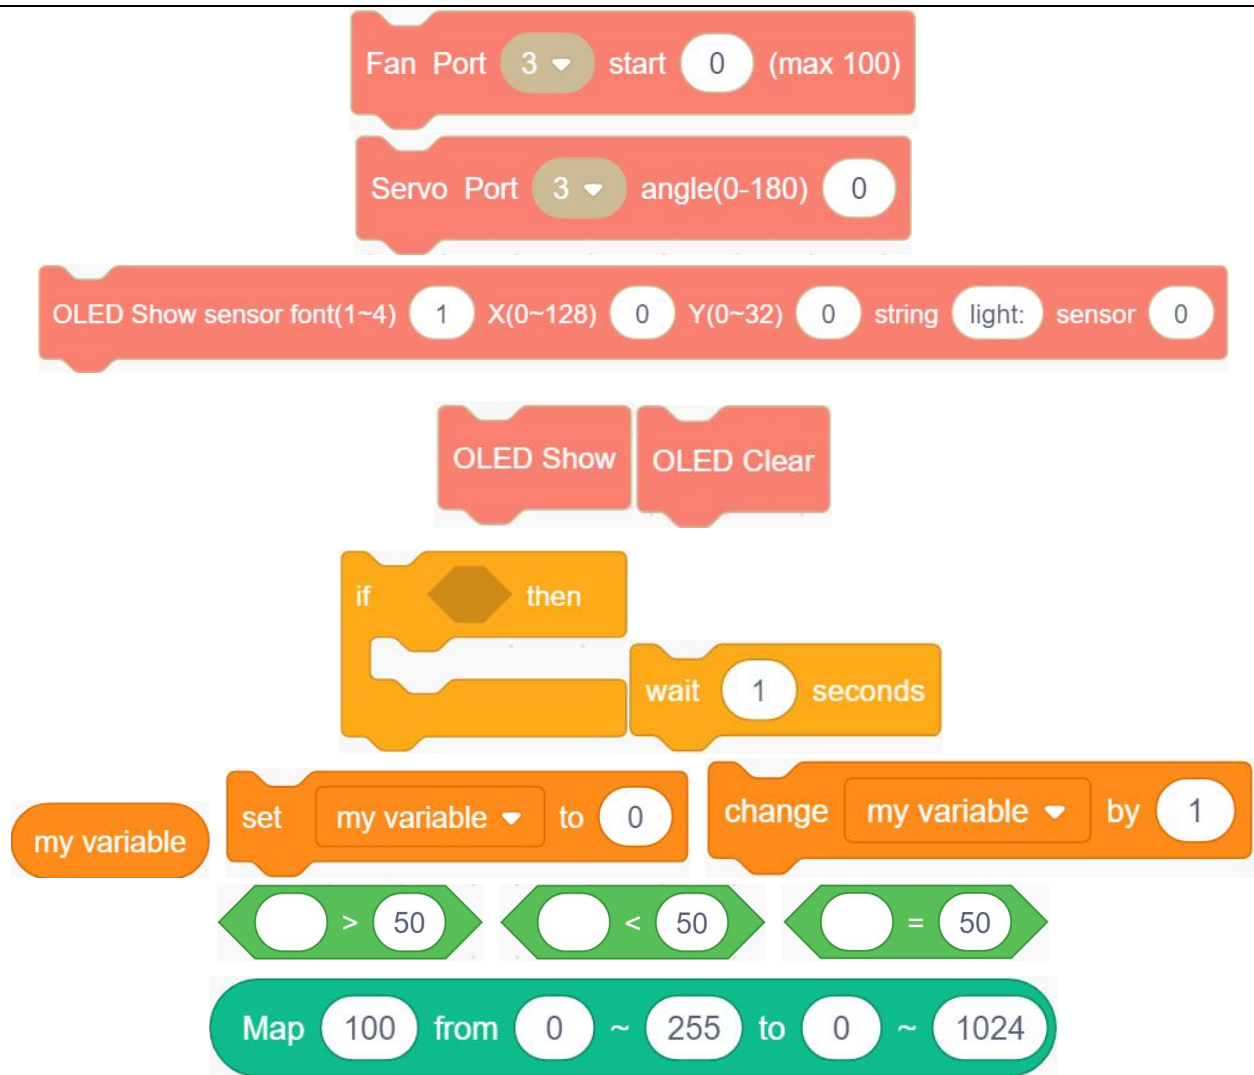

Experimental wiring:

Experimental steps:

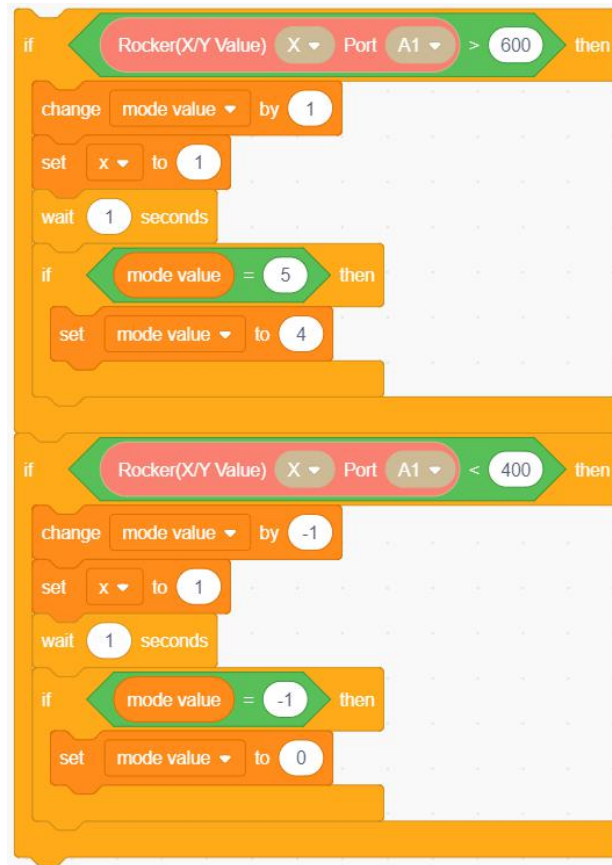

1. Select the following blocks in the [Plugkit], [Control], [Operator], [Variable], [arduino].

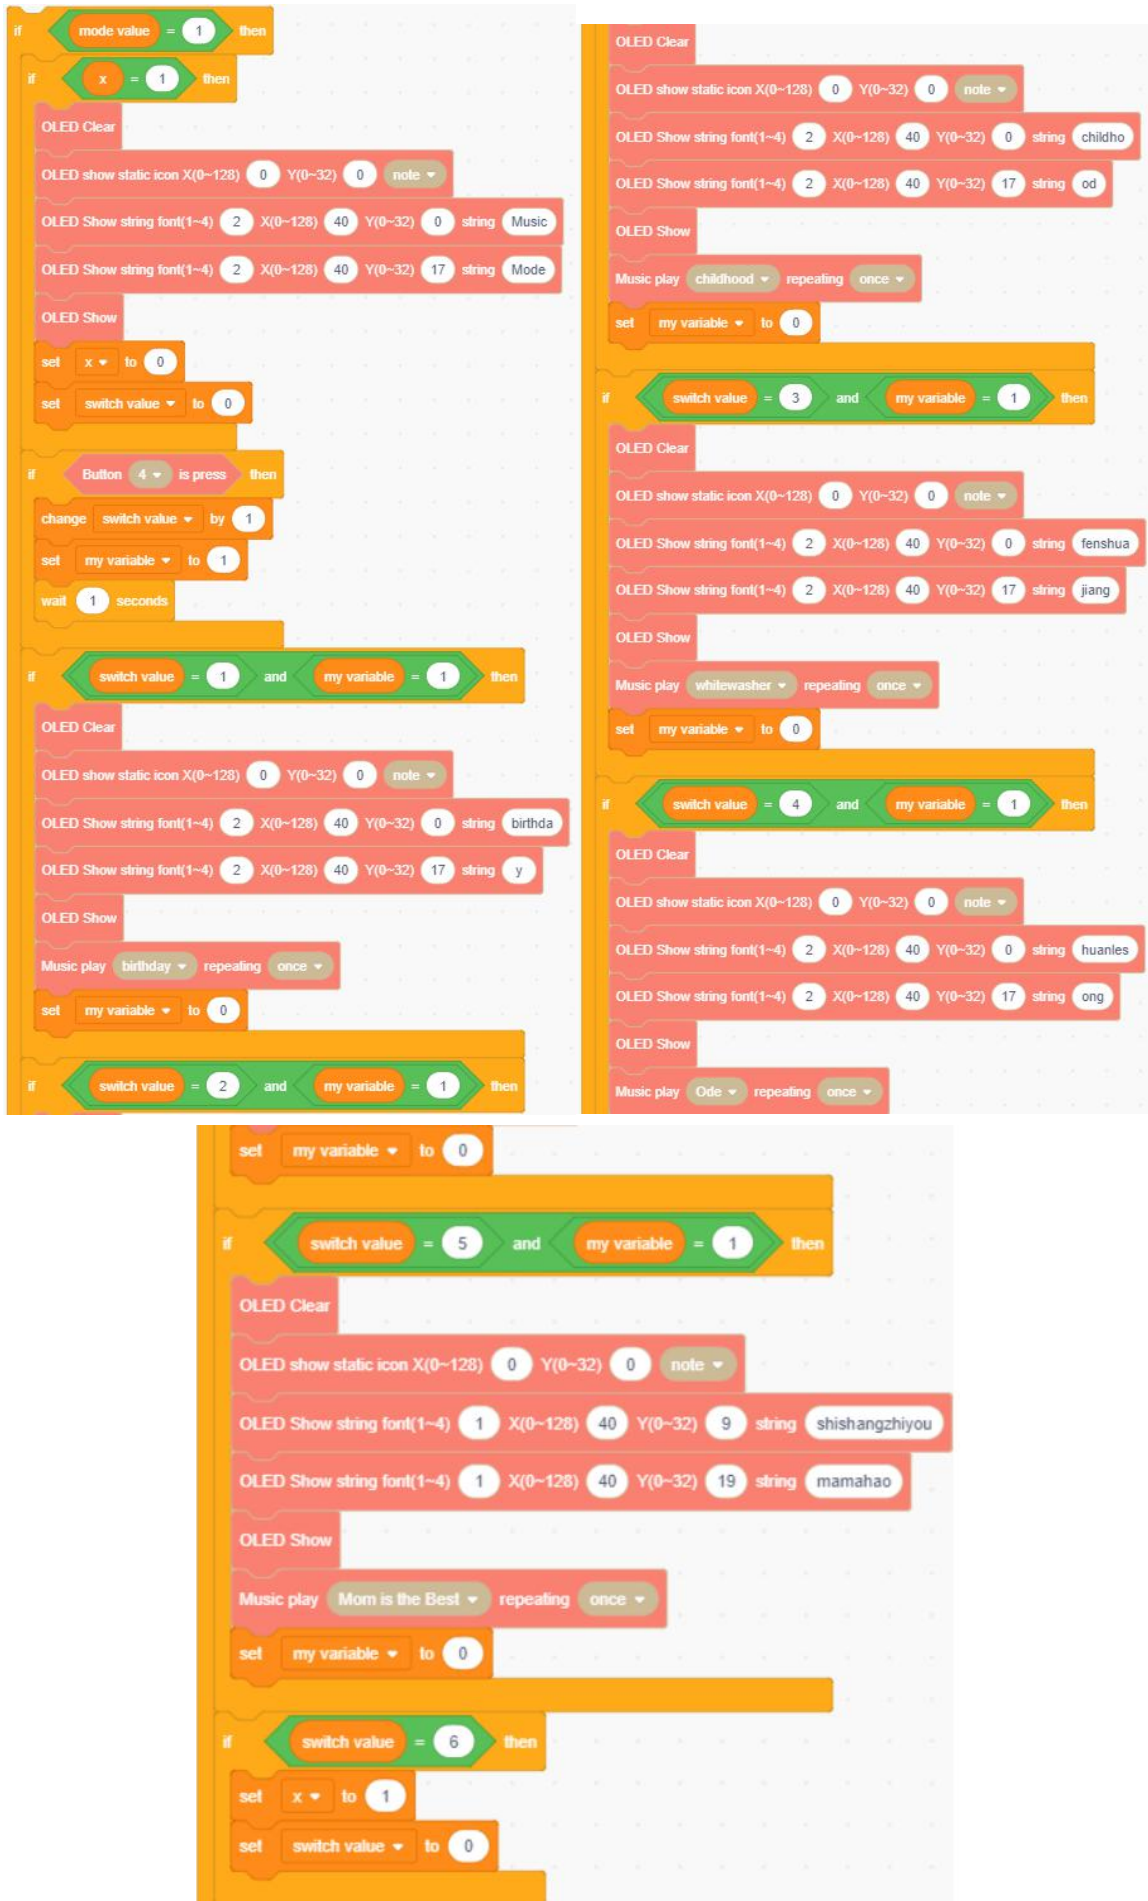

2. Using the rocker to switch the current interface. Move the X direction of the rocker to the left to return to the previous interface. Move the X direction of the rocker to the right to return to the next interface. There are four interfaces in total.

Serial number	Interface
1	Music interface
2	Color light interface
3	Wind speed interface
4	Angle rotation interface

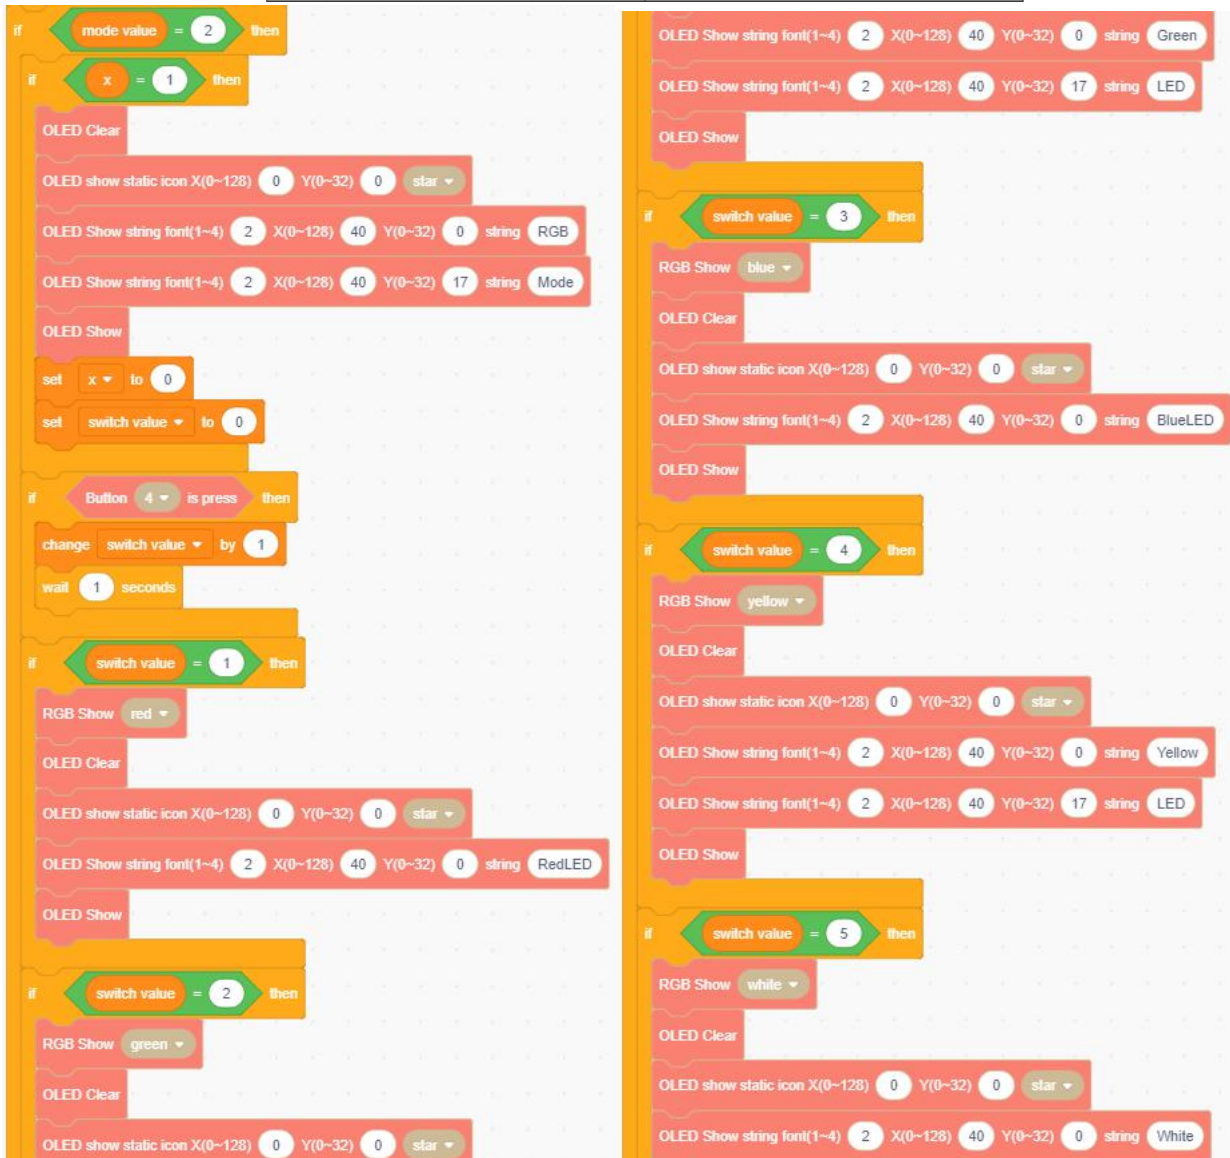

3. In the music interface, when the red button is pressed, the currently playing music will be switched, and there are five pieces of music in total.

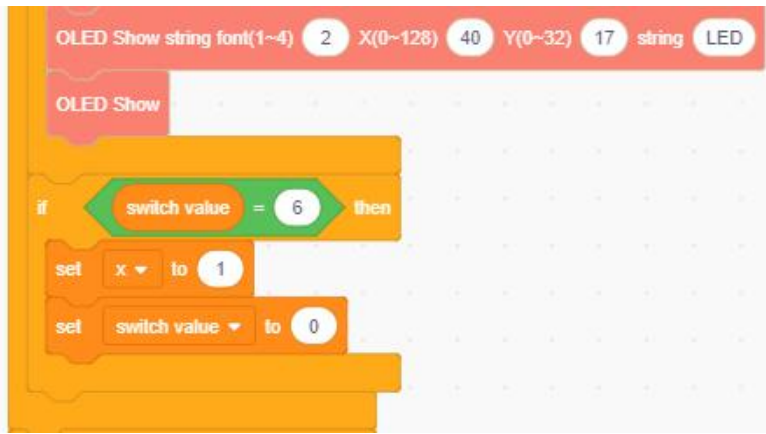

Serial number	Music
1	Birthday song
2	Childhood
3	Painter
4	Ode
5	Praise mother

4. In color light interface, when the red button is pressed, the current light color will be switched. There are five colors in total.

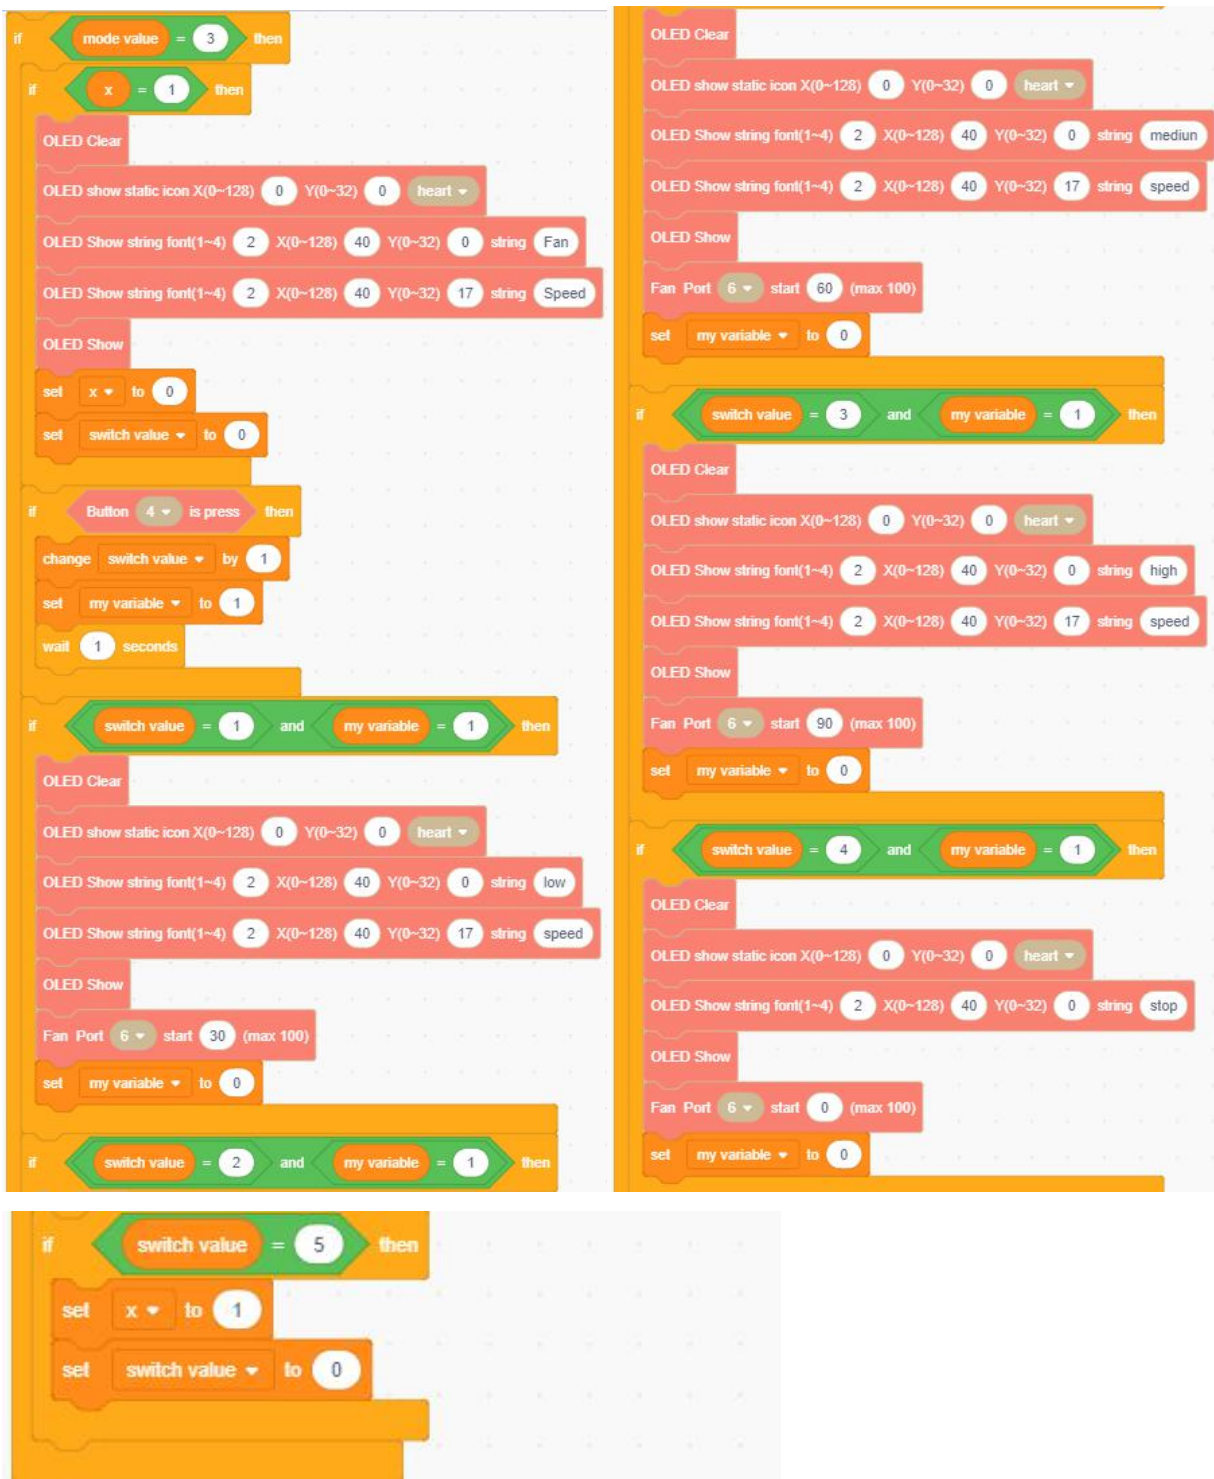

Serial number	Color of light
1	Red light
2	Green light
3	Blue light
4	Yellow light
5	White light

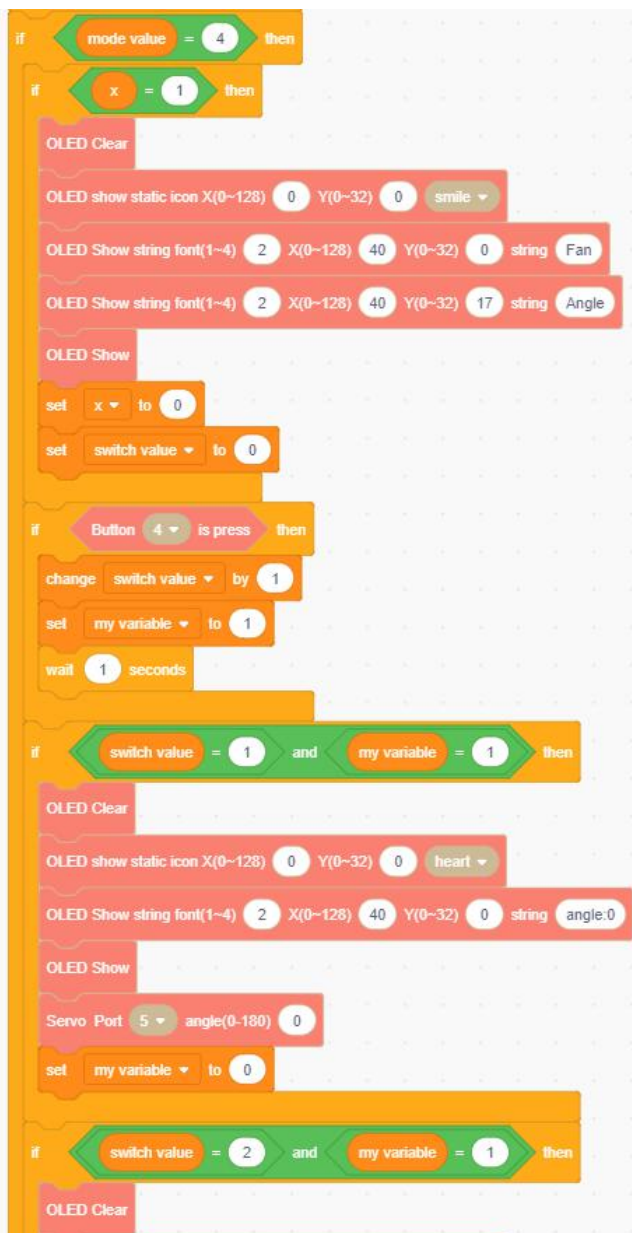

5. In wind speed interface, when the red button is pressed, the current wind speed is switched. There are four gears in total.

Serial number	Wind speed
1	Low speed (30)
2	Medium speed (60)
3	High speed (90)
4	Stop (0)

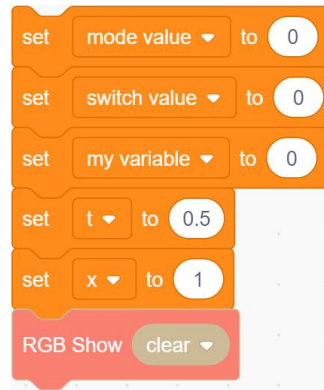

6. In the angle rotation interface, when the red button is pressed, the current rotation angle is switched. There are five rotation angles in total..

Serial number	Angle
1	0°
2	45°
3	90°
4	135°
5	180°

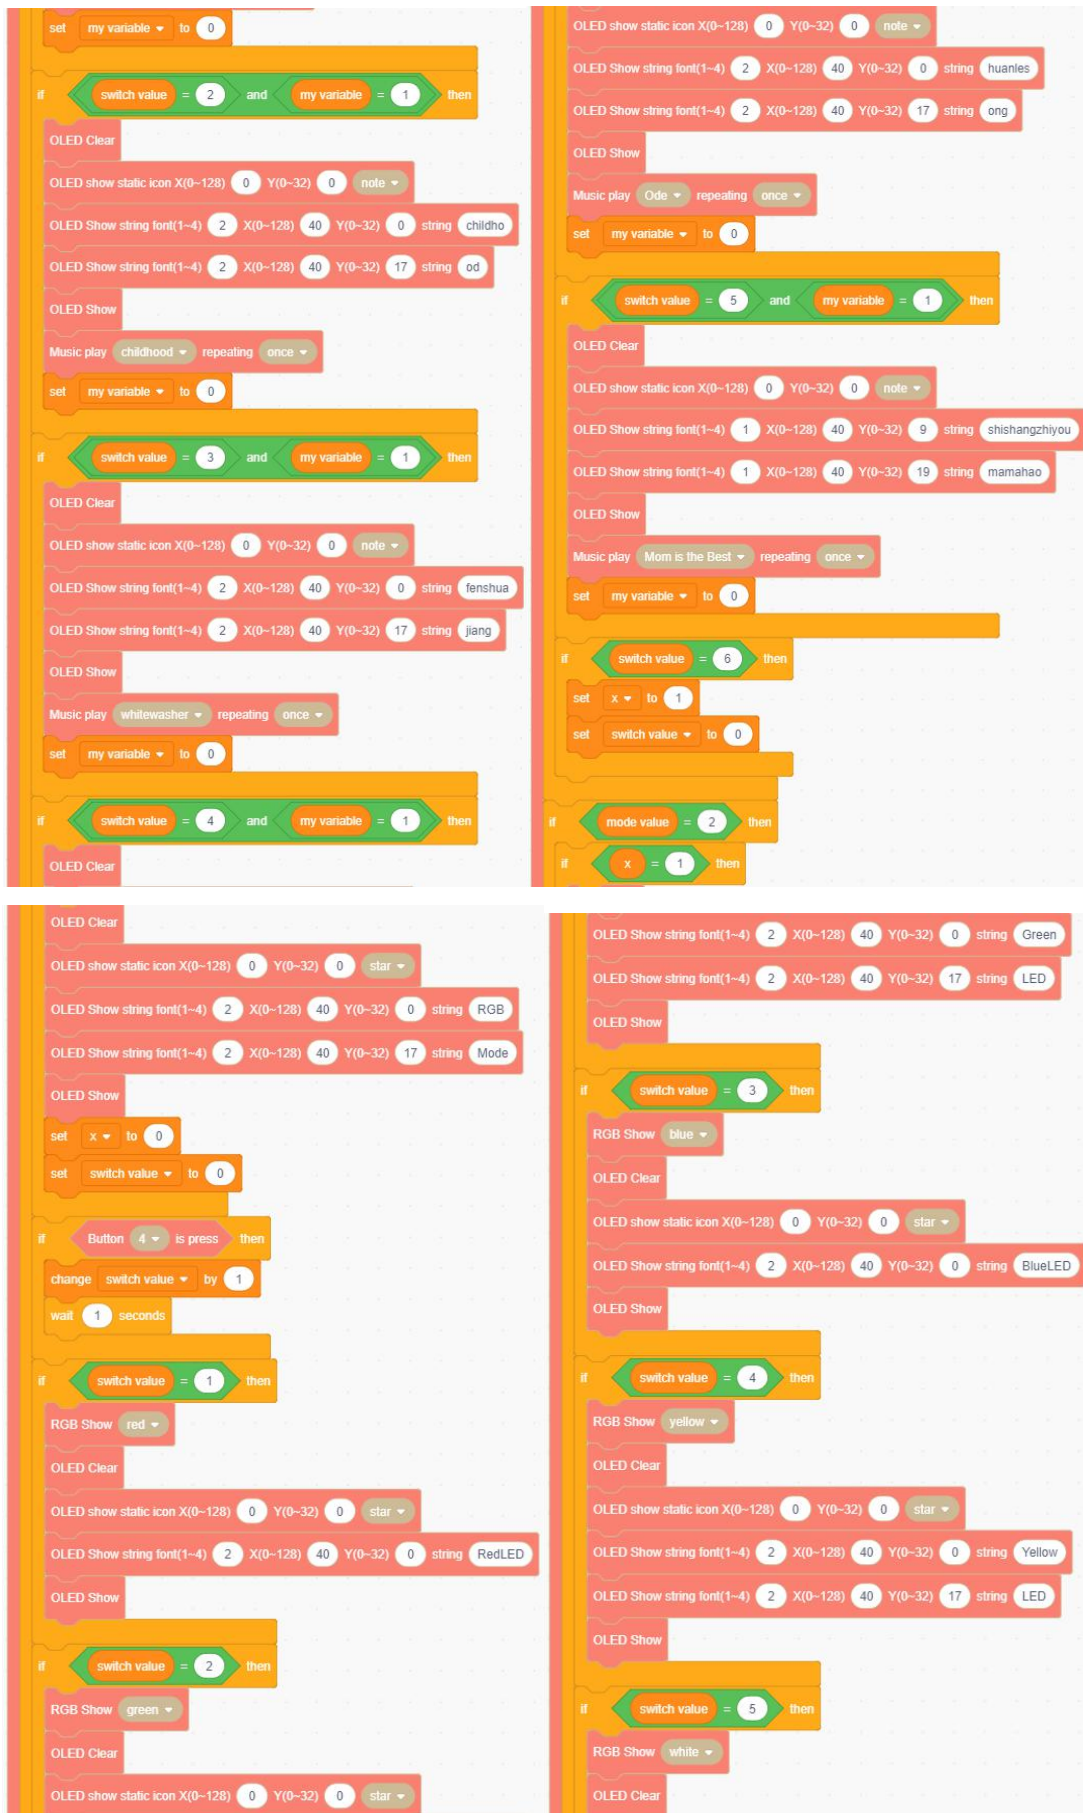

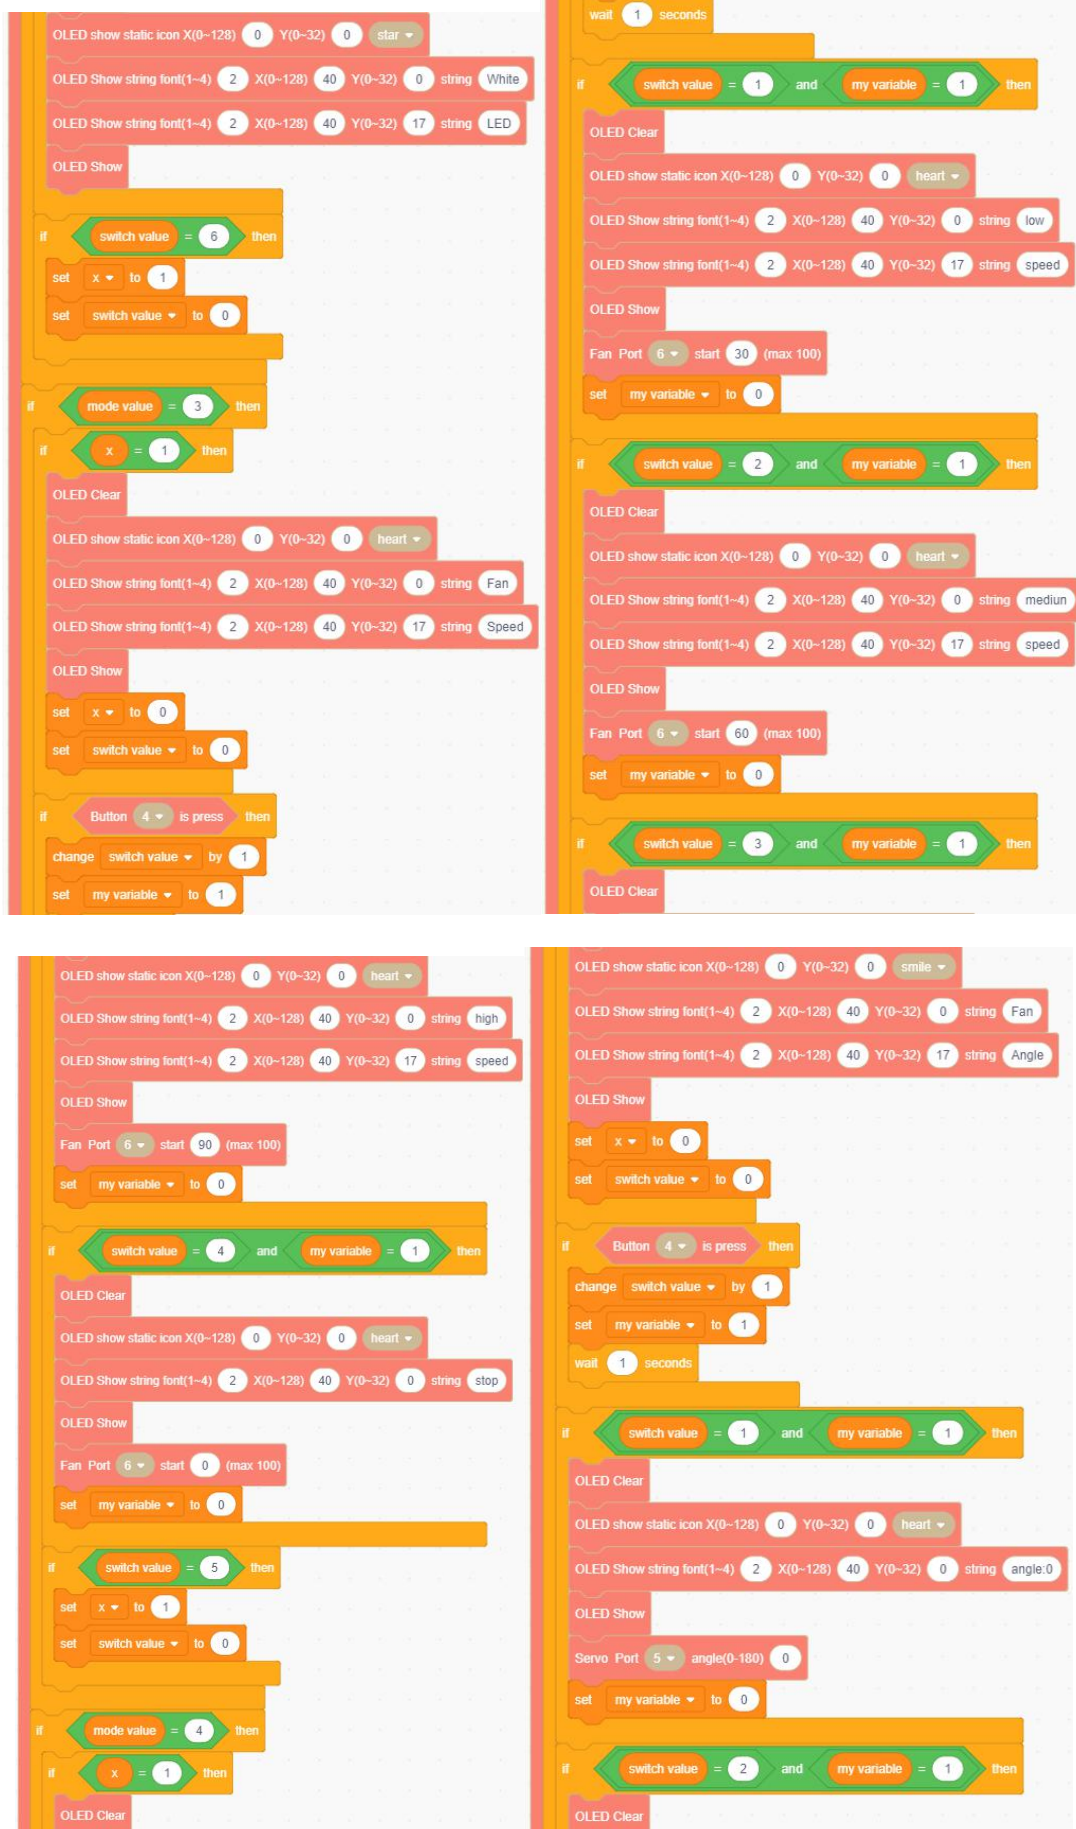

7. Initialize various variables.

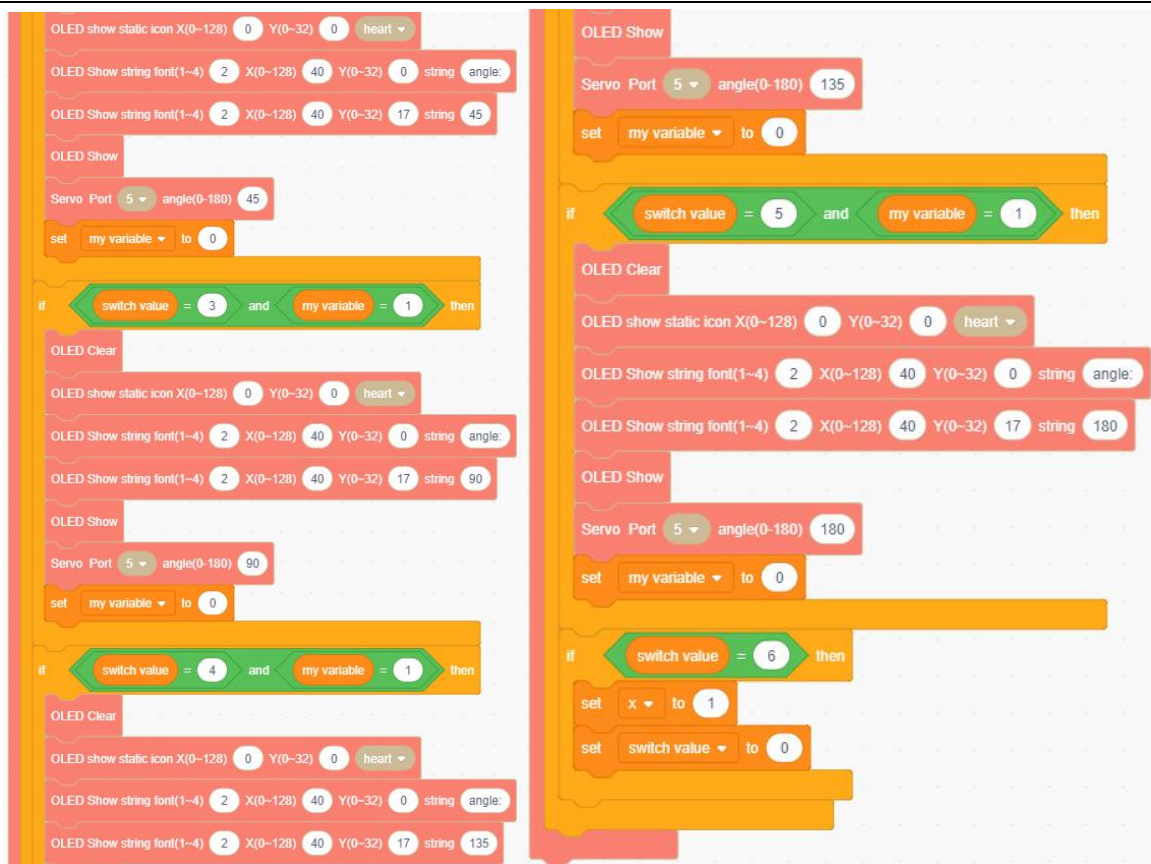

8. Put the initialization part of step 7 into the setup, and combine the blocks of step 2, 3, 4, 5, and 6 (rocker switching mode, mode 1, mode 2, mode 3, mode 4) and put them into the loop block. Because the final program is too long, we only provide program step-by-step. The complete program can refer to the **Smart fan speaker.sb3** file provided by us.

9. Compiling and uploading programs.

Experimental phenomena: Move the X direction of the rocker to the left to return to the previous interface. Move the X direction of the rocker to the right to return to the next interface. There are four interfaces in total. Music interface, Color light interface, angle rotation interface, wind speed interface.

In the music interface, the song is switched by pressing the button.

In the Color light interface, the color of the light is switched by pressing the button.

In the angle rotation interface, the rotation angle of the light is switched by pressing the button.

In the wind speed interface, the wind speed is switched by pressing the button.

Note: If a USB data cable is used to power the UNO board and the restart situation is unstable, it recommended use battery box for power.

**Expand after class**

1. Using four buttons to realize the switching interface, and use the rocker module to switch the song, color of RGB light, wind speed, and rotation angle.
2. Using the sound sensor to switch songs, color of RGB light, wind speed, and rotation angle.
