

Note: Arduino IDE will be bundled if Helloblock is already installed. If Helloblock is not installed, you can install Arduino IDE separately in this tutorial.

User can enter URL in browser: <https://www.arduino.cc/en/Main/Software>

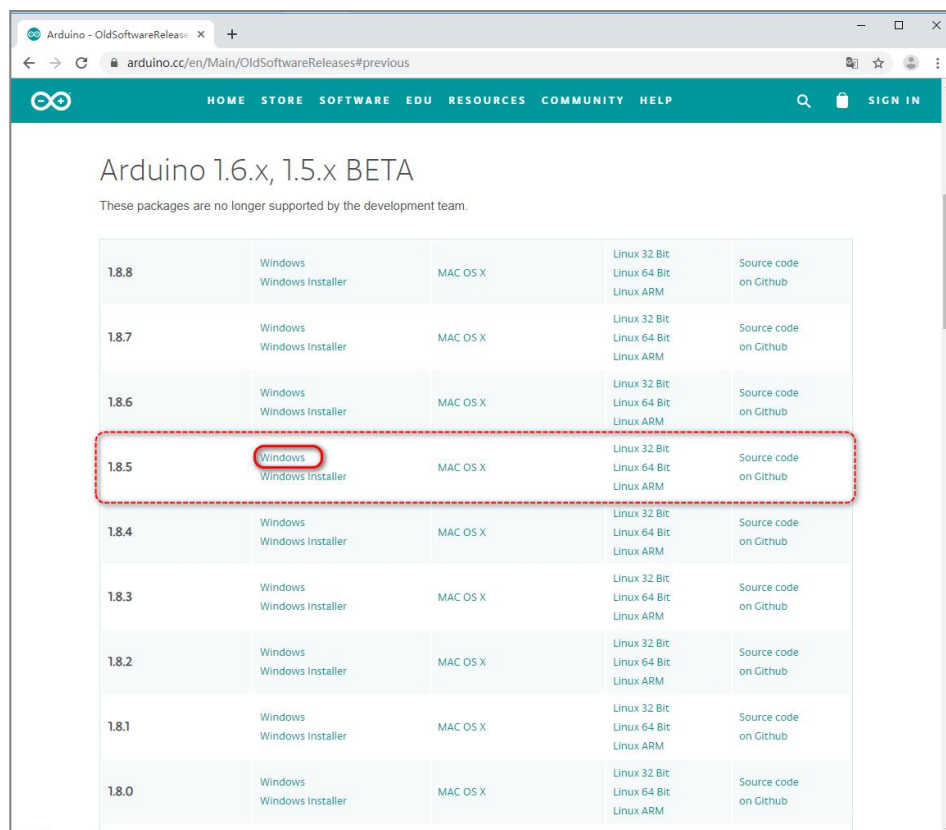

As shown below, we can switch language.

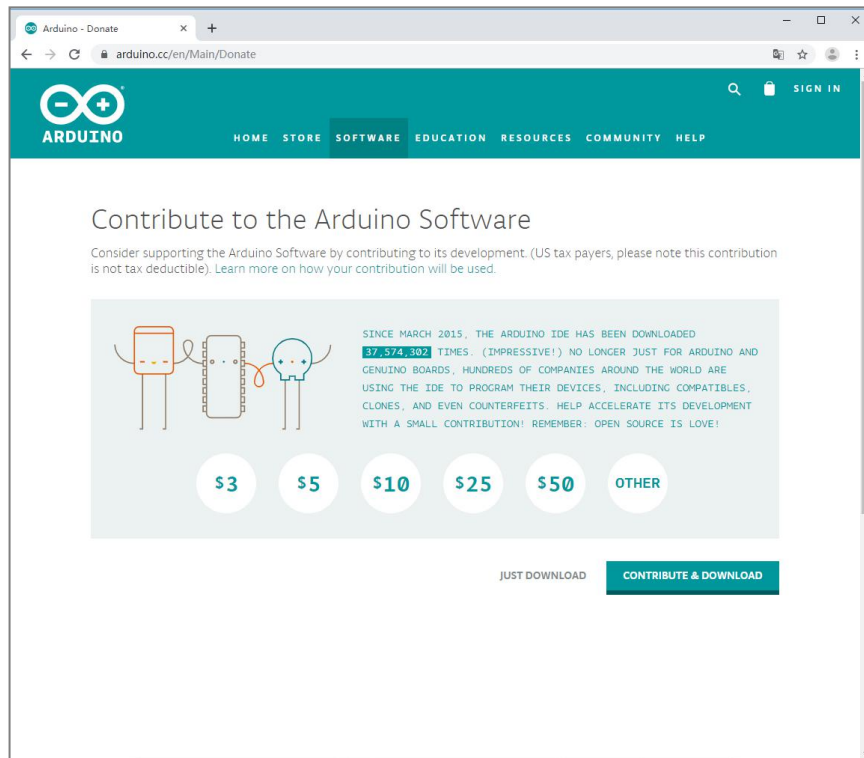

The mouse arrow slides down to Previous Releases, and users can choose the corresponding software to download according to their own use environment.

I download the 1.8.5 version here. So you need to click previous version of the current release to jump to the interface shown in the figure below. The mouse arrow slides down to see the version selection interface as shown below.

Click to download the Windows version we will get a compressed package, download the Windows Installer version we will get an .exe installation file. Users can choose to download the corresponding version according to their needs. I choose to download the Windows version here.

Click "Download" and wait for it to download, we will get an arduino-1.8.5-windows.zip compression package

Extract this compressed package. After extract is complete, we will get a folder. We can double-clicked Arduino.exe in the folder to open it.
